Good luck on your exam!

AWS Global Accelerator

AWS Global Accelerator can find the optimal path from the end user to your web-servers. Global Accelerator are deployed within Edge Locations, so you send user traffic to an Edge Location instead of directly to your web-application.

There are two accelerator types:

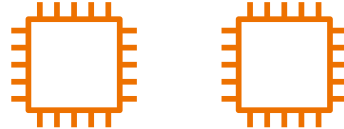

- **Standard** — automatically route to the nearest healthy endpoint
- **Custom Routing** — Route to specific EC2 instances

Listeners (TCP 3000)

Endpoint Group (us-east-1)

Endpoint Group (ca-central-1)

Listeners

Listens for traffic on a specific port and sends traffic to a endpoint group

Endpoint Groups

A collection of endpoints within a specific AWS Region
Traffic dial can be used to change the percentage of traffic

Endpoints

Represents a resource to send traffic to.

An endpoint can be:

- Network Load Balancer
- Application Load Balancer
- EC2 Instances
- Elastic IP Addresses

Global Accelerator has a **speed comparison tool**:

<https://speedtest.globalaccelerator.aws>
