Good luck on your exam!

AWS Transfer for SFTP

AWS Transfer Family offers fully managed support for **the transfer of files over SFTP, AS2, FTPS, and FTP** directly **into and out of Amazon S3 or Amazon EFS**.

- **FTP (File Transfer Protocol)**: An early network protocol without encryption, used for transferring files over a network.
- **SFTP (Secure File Transfer Protocol)**: Uses SSH to provide a secure encrypted connection for transferring files.
- **FTPS (FTP Secure or FTP-SSL)**: Extends FTP with support for SSL/TLS encryption.
- **AS2 (Applicability Statement 2)**: Enables secure and reliable messaging over HTTP/S, often used for EDI (Electronic Data Interchange) transactions. Used in industries like e-commerce and retail that require proof of compliant data transfers.

Common ports for these protocols:

- FTP — port 20 (control commands) and port 21 (data transfer)
- SFTP — port 22
- FTPS — port 990
- AS2 — port 443

Transfer Family Managed File Transfer Workflows

Transfer Family Managed File Transfer Workflows (MFTW) is a fully managed, serverless File Transfer Workflow service to set up, run, automate, and monitor processing of files uploaded using AWS Transfer Family

Workflows allow you to perform the following after a file is uploaded:

- Copy File — Copy to another S3 destination
- Tag File — Apply metadata tagging for S3
- Delete File — Delete File from S3 or EFS
- Custom file-processing Step — Pass file to a lambda to be processed
- Decrypt File — Automatically decrypt file using PGP after uploaded to S3 or EFS
