AWS Batch

AWS Batch plans, schedules, and executes **your batch computing workloads** across the full range of AWS compute services, can utilize Spot Instance to save money.

Jobs — a named unit of work, eg. Shell script, docker container image

Job Definitions — defines how to run the job eg. Amount of compute and memory

Job Queues — a collection of jobs that determine job priority

Job Scheduler — evaluates when, where, and how to run jobs that are submitted to a job queue.

- Defaults to First-In-First-Out (FIFO)

AWS Batch can run jobs on:

- EC2
- Fargate
- EKS
- Array Jobs — a job that shares common parameters, such as the job definition, vCPUs, and memory
- Multit-node parallel Jobs — run single jobs that span multiple Amazon EC2 instances
- GPU Jobs — jobs that run on EC2 GPU-based instance types

Job Dependencies — Allows you to specify a job Id to another job.

Only when that other job complete with the job be scheduled to process
