Good luck on your exam!

Amazon OpenSearch Service

Amazon OpenSearch Service is a managed **full-text search service** that makes it easy to deploy, operate, and scale OpenSearch, a popular open-source search and analytics engine

Two engines can be deployed: **OpenSearch** and **ElasticSearch**

<https://opensearch.org>

OpenSearch is an open-source fork of open-source Elasticsearch 7.10.2 and Kibana 7.10.2. The project was created after Elastic NV changed the license of new versions of this software away from the open-source Apache License in favour of the Server Side Public License (SSPL). AWS was responsible for the development and fork of OpenSearch

Elasticsearch is a search engine based on the Lucene library. Elasticsearch is marketed as free and open

What is the ELK Stack?

Elasticsearch, Logstash, and Kibana are three services commonly used together:

- Elasticsearch — full-text search and analytics engine
- Logstash — data processing pipeline
- Kibana — visualization layer for stored data
