Good luck on your exam!

AWS Directory Service

AWS Directory Service provides multiple ways to use Microsoft Active Directory (AD)

Lets you use existing Microsoft AD–aware or Lightweight Directory Access Protocol (LDAP)–aware applications in the cloud.

Simple AD (Not available in all regions)

A Microsoft AD compatible directory powered by Samba 4. Supports basics AD features
Samba is a open-source implementation of Server Message Block (SMB)

AD Connector

A proxy service to connect your existing on-premise AD Directory

AWS Managed Microsoft AD

A full feature managed version of Microsoft Windows Server Active Directory (AD)

Amazon Cognito

Integrate signup and sign-in into your web-applications.

Amazon Cloud Directory

Amazon Cloud Directory is a full managed cloud-based directory that **stores hierarchal data**.

Schema – A json file defining Facets (objects) and Typed Link Facets (links between objects)

Facet — A facet is made up of a set of attribute definitions.

Multiple schemas can be used in the same Cloud Directory Instance

Schemas are published with a version and then become immutable (similar to API Gateway deployments)
